Overview

How It Works

Features & Benefits

Single Sign-On (SSO) is a session/user authentication process that permits a user to enter one set of credentials in order to access multiple applications. The process authenticates the user for all the applications they have been given rights to and eliminates further prompts when they switch applications during a particular session.

There are various types of SSO, and 'Identity Provider Initiated Logon' is what RLDatix uses for implementation. When a user is logged into your organisation's network and clicks a link to Assure Expenses, a message will be sent to your Identity Provider which will acknowledge that the user is on the network. The Identity Provider then sends an encrypted access token to Assure Expenses which is decrypted, then the user is confirmed, and access is granted to the product.
