Date: 26/09/19
Version: 2019.9.26.1

Enhancements

- We've added a new API endpoint (POST Account/Logout) which logs the calling user out, revoking the active AuthToken. This has been introduced in preparation for another piece of work to further improve security. (168279)

Bug Fixes

- Fixed an issue where a vehicle registration was being shown against expense items that do not require a vehicle. This occurred when users had an active vehicle and set the vehicle registration to show on the expense grid. Now, users will only be shown the vehicle icon on the following types of expense item:

  - Mileage (Pence Per Mile)
  - Mileage (Based on Fuel Receipt)
  - Fixed Excess Mileage. (59031)

- Fixed an issue where the project code was not filtered correctly on an expense when a default cost code was set. This occurred for users who were permitted to view and edit cost codes/project codes on an expense. When saving after changing from the default cost code, the list of project codes would default back to those which displayed for the default cost code. The expense item would not save. (164431)

- Fixed an issue where home to location steps were being removed from a journey when an approver changed the date of the expense. (166198)
