Release Notes - 25 July 2023

Last Modified on 06/11/2024 2:04 pm GMT

Date: 25/07/2023
Version: 2023.7.24.1

Bug Fixes

- We've fixed a performance issue where the system was running slowly when synchronising employee records from the NHS ESR import. (192619)
- We've fixed a performance issue related to the "Count Unallocated Claims" script. The error is no longer reproducible. (192631)

Enhancements

- We've removed an unnecessary API endpoint related to the API call status to reduce the number of calls made in the system and improve the performance of the API requests. (184658)
- We've removed unnecessary login attempts to the previously used customer portal "Circle" to improve system performance. (190041)
- We've made a performance improvement to reduce the number of redundant calls to Expedite validate results. (192638)
- We've made a performance improvement to reduce the number of calls to OCR to retrieve receipt details. (192639)
- We've improved the exception handling of receipt 404 status reports that were handled as a 500 exception, which caused unnecessary traffic. This helps to improve the performance of the receipt wallet. (192640)
- We've upgraded "Stack.Exchange" to the latest version to reduce the number of errors and improve the performance. (192642)
- We've removed unnecessary bank account calls when retrieving an employee record to improve the performance. Previously, the system was making the call to retrieve accounts for all employees regardless of whether the employee had a bank account set up. (192661)
- We've made an improvement to the mobile address journey builder. Previously, you had to enter two or more characters to get matching results. Now, suggested addresses are displayed in the search after you enter the first character. (192662)
- We've set the database connection strings to the optimal value to optimise the system and improve the performance. (192648)
- We've made an improvement to the authentication process to ensure that users are not affected by the SSO methods. Now, the system first checks if you used the traditional login method with a username and password, and then checks the SSO authentication methods. (192815)
